SUMMARY

AI engineer who designs and builds working LLM systems, mostly retrieval-backed assistants and tools that keep a human in charge of the final decision. Drove an enterprise AI assistant from a written proposal through VP and committee approval to pilot stage inside a healthcare company. Seven years of enterprise systems support before that. Builds in public: 45 active repos, at least 9 live, mostly React/TypeScript frontends with Python/FastAPI backends, pgvector retrieval, and Firebase or Cloudflare deployment.

HOW I WORK

I am neurodivergent, with Autism Level 1 and ADHD, and I say so up front because it shapes how I work and what I am good at. I do my best work with written expectations, direct communication, and a predictable schedule, and I need advance notice when plans change. In return I bring deep, sustained focus on hard problems, strong pattern recognition, and a habit of finding the process failure underneath the symptom. I communicate directly and say what I actually think. That is how a claims examiner ended up driving an AI pilot through a VP and two enterprise committees. If your team values candor and systems thinking, we will work well together.

EXPERIENCE

AI Product Engineer (Independent) | 2025 – Present

Design and build AI products from the first sketch of the problem through deployment and evaluation.

- Build LLM systems that get used in production: retrieval-backed assistants that cite their sources, automation kept inside set bounds with human review and override, and hybrid workflows that mix deterministic steps with generated output.
- Test before calling anything done: structured A/B comparisons between models, linting and type checks, Playwright browser verification, and a check of the live deployment.
- Document the working method as I go: inspect before editing, set explicit trust boundaries, keep changes scoped, and make every deployment traceable.

Claims Examiner I | Capital Blue Cross | 2025 – 2026

- Found recurring process failures in complex claims workflows and proposed fixes. Flagged more improvement opportunities than the review pipeline could absorb.
- Wrote an AI assistant proposal for claims workflows, designed to be safe around PHI, with source grounding, linked-step navigation, human review gates, and clear governance boundaries. Won backing from a VP and both enterprise AI committees. The proposal projected 40,000 labor hours a year in savings, and the pilot was approved.
- Began building the assistant in Copilot Studio and set up the A/B evaluation plan for measuring its effect on examiner throughput and accuracy.
- Learned the Facets claims platform and its complex plan rules fast. The job confirmed that system design and automation is where I do my best work.

Help Desk Analyst / Enterprise Systems Support | ICU Medical (via Randstad) | 2018 – 2025

- Supported 3,000+ enterprise users across Microsoft 365, Active Directory, Azure AD, Oracle EBS, VPN/VDI, and ServiceNow.
- Turned recurring support problems into permanent fixes: scripts, macros, documentation, and escalation

templates that cut down repeat tickets.

- Proposed an AI assistant to make the service desk more efficient. That proposal started my move into AI systems work.

SELECTED PROJECTS

- **Delivery Composer**: AI-assisted consulting staffing workflow (React, FastAPI, PostgreSQL/pgvector). Turns an unstructured client brief into requirements and candidate evidence, then walks a human reviewer through the recommendation, any override, and re-evaluation. Score deltas and eligibility gates stay visible throughout, and the final decision stays with the human. github.com/Angry-TacoZ/delivery-composer
- **Living Resume / Recruiter Assistant**: Source-grounded, recruiter-facing portfolio assistant (React/Vite, Firebase Hosting/Functions) with verified resume data and voice guidance. The portfolio interviews itself. jamesai.space
- **CogFit Jobs**: Explainable AI work-fit interface: turns a structured profile plus a job posting into visible fit dimensions, confidence levels, evidence, and improvement guidance.
- **Ambient AI Shopping Concept**: Retail AI interaction model with browser-local memory the user can inspect, edit, and undo, and recommendations that show their tradeoffs instead of one opaque answer.

TECHNICAL SKILLS

AI/LLM: RAG design, prompt engineering, agent workflows, evaluation harnesses, source grounding, human-in-the-loop design, Copilot Studio

Languages/Frameworks: TypeScript, JavaScript, Python, React, Vite, FastAPI, Framer Motion, HTML/CSS

Data/Backend: PostgreSQL, pgvector, SQLite, REST/JSON APIs, Firebase (Hosting/Functions/Auth/App Check), Cloudflare Workers

Quality/Delivery: Git/GitHub, GitHub Actions, CI/CD, Vitest, Playwright, pytest, ESLint, deployment verification

EDUCATION & CERTIFICATIONS

High School Diploma, Hephzibah High School

Certifications: AI Fluency: Framework & Foundations (Anthropic) · Generative AI Fundamentals (Databricks) · Business Analysis Foundations · Prompt Engineering and AI Agents (LinkedIn Learning)
